ASTROPHYSICAL MOTIVATION

Discovery of X-ray emission coming from the accretion disks around the black holes

connect

Study how the matter around the black holes appears to an observer at infinity

first simulations

Luminet 1979

Image of a black hole

RAY-TRACING METHOD

INTRODUCTION

Numerical simulation of an accretion disk placed around a black hole

1.1 Geometrical structure

TARGETS

- LIGHT BENDING (*elliptic integral*)
- TRAVEL TIME (*elliptic integral*)
- GRAVITATIONAL LENSING (*elliptic integral*)
- GRAVITATIONAL REDSHIFT (*exact*)
- FLUX (*derived*)

$$g = (1 + z) = \frac{E_{obs}}{E_{em}} = \frac{(V^\alpha k_\alpha)_{obs}}{(U^\alpha k_\alpha)_{em}}$$

$$F = \int_{\nu_o} \int_R \int_\varphi I_{\nu_o} d\nu_o d\Omega$$

1.2 Simulations of the gravitational effects

Numerical simulations showing the gravitational effects mentioned before:

$i=30^\circ$

$i=60^\circ$

$i=89^\circ$

→
The relativistic effects become stronger and stronger

ELLIPTIC INTEGRALS

Kandinsky - Composition VIII (1923)

2.1 Light bending

(*) Misner, Thorne & Wheeler - Gravitation

$$\theta = \int_R^\infty \frac{b}{r^2} \left[1 - \frac{b^2}{r^2} \left(1 - \frac{2M}{r} \right) \right]^{-\frac{1}{2}} dr$$

Substitution ad hoc

$$z = 1 - \cos \alpha$$

↓ in

$$b = \frac{r \sin \alpha}{\sqrt{1 - \frac{2M}{r}}} \quad (*)$$

↓

considering α small

Mathematical algebra

Beloborodov (2002)

Beloborodov (2002)

$$(1 - \cos \theta)(1 - u) = 1 - \cos \alpha \quad \text{where} \quad u = \frac{r_s}{r}$$

2.2 Time delay

(*) *Misner, Thorne & Wheeler - Gravitation*

$$\Delta t = \int_R^\infty \frac{dr}{\left(1 - \frac{2M}{r}\right)} \left\{ \left[1 - \frac{b^2}{r^2} \left(1 - \frac{2M}{r} \right) \right]^{-\frac{1}{2}} - 1 \right\}$$

Substitution ad hoc

$$z = 1 - \cos \alpha$$

↓ in

$$b = \frac{r \sin \alpha}{\sqrt{1 - \frac{2M}{r}}} \quad (*)$$

↓

considering α small

Mathematical algebra

Poutanen & Beloborodov (2006)

Poutanen & Beloborodov (2006)

$$\frac{\Delta t}{R} = y \left[1 + \frac{uy}{8} + \frac{uy^2}{24} - \frac{u^2y^2}{112} \right] \quad \text{where} \quad u = \frac{r_s}{r} \quad y = \frac{(1 - \cos \alpha)}{(1 - u)}$$

2.3 Solid angle

(*) *Misner, Thorne & Wheeler - Gravitation*

$$d\Omega = \overbrace{\frac{\cos i}{D^2 \sin^2 \theta \left(1 - \frac{2M}{R}\right)}}^{\text{par1}} \overbrace{\frac{\sin^2 \alpha}{\cos \alpha}}^{\text{par2}} \overbrace{\left\{ \int_R^\infty \frac{dr}{r^2} \left[1 - \frac{b^2}{r^2} \left(1 - \frac{2M}{r} \right) \right]^{-\frac{3}{2}} \right\}^{-1}}^I$$

equation found so far

MATHEMATICAL METHOD

M. C. Escher - Relativity (1953)

3.1 Method

- Approximate the elliptic integrals with polynomial equations

$$\begin{array}{ccc} \int f(x)dx & \longrightarrow & P(x) \\ \textit{elliptic function} & & \textit{polynomial} \end{array}$$

- Get rid of the square root present in the integral

$$\begin{array}{ccc} \sin \alpha = g(z) & \longrightarrow & z = z(\alpha) \\ \textit{general function} & & \end{array}$$

- We assume that α is small, so we have:

$$g(z) = \sin \alpha \approx \alpha \approx 0 \quad \longrightarrow \quad \text{expand in } \textit{Taylor series} \text{ the integrand } f(x)$$

3.2 Light bending

$$\begin{aligned}
 \Psi &= \int_R^\infty \frac{dz}{z^2} \left[\frac{1}{b^2} - \frac{1}{z^2} \left(1 - \frac{r_g}{z} \right) \right]^{-\frac{1}{2}} = b \int_R^\infty \frac{dz}{z^2} \left[1 - \frac{b^2}{z^2} \left(1 - \frac{uR}{z} \right) \right]^{-\frac{1}{2}} = \\
 &= b \int_R^\infty \frac{dz}{z^2} \left[1 - \underbrace{\frac{R^2 g^2(z)}{z^2(1-u)}}_{\text{LINEARE}} \left(1 - \frac{uR}{z} \right) \right]^{-\frac{1}{2}} \approx (1-y)^{-\frac{1}{2}} \approx 1 + \frac{y}{2} + \frac{3}{8} y^2 + \frac{5}{16} y^3 \\
 &\approx b \int_R^\infty \frac{dz}{z^2} \left[1 + \underbrace{\frac{R^2 g^2(z)}{z^2(1-u)} \left(1 - \frac{uR}{z} \right)}_{\text{QUADRATICO}} + \frac{3}{8} \left[\frac{R^2 g^2(z)}{z^2(1-u)} \left(1 - \frac{uR}{z} \right) \right]^2 + \frac{5}{16} \left[\frac{R^2 g^2(z)}{z^2(1-u)} \left(1 - \frac{uR}{z} \right) \right]^3 \right] = \\
 &= b \int_R^\infty dz \left[\frac{1}{z^2} + \frac{R^2 g^2(z)}{z^4(1-u)} - \frac{R^3 g^2(z) u}{z^5(1-u)} + \frac{3}{8} \left[\frac{R^4 g^4(z)}{z^6(1-u)^2} \left(1 + \frac{u^2 R^2}{z^2} - \frac{2uR}{z} \right) + \frac{5}{16} \left[\frac{R^6 g^6(z)}{z^8(1-u)^3} \left(1 - \frac{u^3 R^3}{z^3} + \frac{3uR}{z} + \frac{3u^2 R^2}{z^2} \right) \right] \right] \right] \\
 &= b \int_R^\infty \left[\frac{1}{z^2} + \frac{R^2 g^2(z)}{z^4(1-u)} - \frac{R^3 g^2(z) u}{z^5(1-u)} + \frac{3}{8} \frac{R^4 g^4(z)}{z^6(1-u)^2} + \frac{3}{8} \frac{R^6 g^4(z) u^2}{z^8(1-u)^2} - \frac{3}{4} \frac{R^5 g^4(z) u}{z^7(1-u)^2} + \right. \\
 &\quad \left. + \frac{5}{16} \frac{R^6 g^6(z)}{z^8(1-u)^3} - \frac{5}{16} \frac{R^9 g^6(z) u^3}{z^{11}(1-u)^3} - \frac{15}{16} \frac{R^7 g^6(z) u}{z^9(1-u)^3} + \frac{15}{16} \frac{R^8 g^6(z) u^2}{z^{10}(1-u)^3} \right] dz = \\
 &= \frac{b}{R} \left[1 + \frac{g^2(z)}{6(1-u)} - \frac{g^2(z) u}{8(1-u)} + \frac{3}{40} \frac{g^4(z)}{(1-u)^2} + \frac{3}{56} \frac{g^4(z) u^2}{(1-u)^2} - \frac{1}{8} \frac{g^4(z) u}{(1-u)^2} + \right. \\
 &\quad \left. + \frac{5}{112} \frac{g^6(z)}{(1-u)^3} - \frac{1}{32} \frac{g^6(z) u^3}{(1-u)^3} - \frac{15}{128} \frac{g^6(z) u}{(1-u)^3} + \frac{5}{48} \frac{g^6(z) u^2}{(1-u)^3} \right] =
 \end{aligned}$$

$b = \frac{R \sin \alpha}{\sqrt{1 - \frac{r_g}{R}}}$, $u = \frac{r_g}{R}$, $\sin \alpha = g(z)$
 $\downarrow$
 $b = \frac{R g(z)}{\sqrt{1-u}}$

- Having even powers of $g(z)$ and researching a complete polynomial function, we choose:

$$g(z) = \sqrt{Az^2 + Bz}$$

$$\begin{aligned}
 &= \sqrt{\frac{Az^2 + Bz}{1-u}} \left[1 + \frac{Az^2 + Bz}{6(1-u)} - \frac{(Az^2 + Bz)u}{8(1-u)} + \frac{3}{40} \frac{(Az^2 + Bz)^2}{(1-u)^2} + \frac{3}{56} \frac{(Az^2 + Bz)^2 u^2}{(1-u)^2} - \frac{1}{8} \frac{(Az^2 + Bz)^2 u}{(1-u)^2} + \right. \\
 &\quad \left. + \frac{5}{112} \frac{(Az^2 + Bz)^3}{(1-u)^3} - \frac{1}{32} \frac{(Az^2 + Bz)^3}{(1-u)^3} u^3 - \frac{15}{128} \frac{(Az^2 + Bz)^3}{(1-u)^3} u + \frac{5}{48} \frac{(Az^2 + Bz)^3}{(1-u)^3} u^2 \right] \approx \text{TERZO ORDINE IN } z \\
 &\approx \sqrt{\frac{Az^2 + Bz}{1-u}} \left[1 + \frac{Az^2 + Bz}{6(1-u)} - \frac{(Az^2 + Bz)u}{8(1-u)} + \frac{3}{40} \frac{(B^2 z^2 + 2ABz^3)}{(1-u)^2} + \frac{3}{56} \frac{(B^2 z^2 + 2ABz^3)u^2}{(1-u)^2} - \right. \\
 &\quad \left. - \frac{1}{8} \frac{(B^2 z^2 + 2ABz^3)u}{(1-u)^2} + \frac{5}{112} \frac{B^3 z^3}{(1-u)^3} - \frac{1}{32} \frac{B^3 z^3}{(1-u)^3} u^3 - \frac{15}{128} \frac{B^3 z^3 u}{(1-u)^3} + \frac{5}{48} \frac{B^3 z^3 u^2}{(1-u)^3} \right] = \\
 &= \sqrt{\frac{Az^2 + Bz}{1-u}} \left[1 + \left(\frac{B}{6(1-u)} - \frac{Bu}{8(1-u)} \right) z + \left(\frac{A}{6(1-u)} - \frac{Au}{8(1-u)} + \frac{3B^2}{40(1-u)^2} + \frac{3B^2 u^2}{56(1-u)^2} - \frac{1}{8} \frac{B^2 u}{(1-u)^2} \right) z^2 + \right. \\
 &\quad \left. + \left(\dots \dots \right) z^3 \right]
 \end{aligned}$$

- To find the approximation we compare the approximation with the original form in a particular computing convenience case. We choose $u=0$ and $R=1$, so we have:

$$\begin{aligned} \Psi &= b \int_R^\infty \frac{dz}{z^2} \left[1 - \frac{R^2 \sin^2 \vartheta}{z^2 (1-u)} \left(1 - \frac{uR}{z} \right) \right]^{-\frac{1}{2}} \stackrel{u=0, R=1}{=} b \int_1^\infty \frac{dz}{z^2} \left[1 - \frac{\sin^2 \vartheta}{z^2} \right]^{-\frac{1}{2}} = b \int_1^\infty \frac{z dz}{z^2 \sqrt{z^2 - \sin^2 \vartheta}} \stackrel{x^2 = z^2 - \sin^2 \vartheta}{=} \\ &= b \int_{\cos \vartheta}^\infty \frac{x dx}{x(x^2 + \sin^2 \vartheta)} = \frac{b}{\sin \vartheta} \int_{\cos \vartheta}^\infty \frac{dx}{\sin \vartheta \left[\frac{x^2}{\sin^2 \vartheta} + 1 \right]} = \left[\arctan \frac{x}{\sin \vartheta} \right]_{\cos \vartheta}^\infty = \frac{\pi}{2} - \arctan \cot \vartheta = \vartheta \end{aligned}$$

- We have to get rid of the square root with an even trigonometric function, so we have:

$$\begin{aligned} \text{(GIUSTIFICARE)} \quad 1 - \cos \Psi &\approx \frac{\Psi^2}{2} - \frac{\Psi^4}{24} \stackrel{\text{3° ORDINE IN } z \text{ IN PARENTESI}}{\approx} \left[\frac{Az^2 + Bz}{z(1-u)} \right] \left[1 + c^2 z^2 + 2cz + 2Dz^2 + 2CDz^3 \right] - \\ &- \frac{1}{24} \left[\frac{B^2 z^2 + 2ABz^3}{(1-u)^2} \right] \left[1 + c^2 z^2 + 2cz + 2Dz^2 + 2CDz^3 \right] \stackrel{\text{NON PROPRIO ESATTO MA RESTA 1}}{\approx} \text{APPROSSIMAZIONE AL 3° ORDINE IN } z \\ &\approx \frac{Bz}{z(1-u)} \left[1 + 2cz + (c^2 + 2D)z^2 \right] + \frac{Az^2}{z(1-u)} \left[1 + 2cz \right] - \\ &- \frac{1}{12} \frac{ABz^3}{(1-u)^2} - \frac{1}{24} \frac{B^2 z^2}{(1-u)^2} \left[1 + 2cz \right] = \end{aligned}$$

$$\begin{aligned}
&= \frac{Bz}{2(1-u)} + \left[\frac{B\overset{\text{notituisce il valore di } C}{C}}{(1-u)} + \frac{A}{2(1-u)} - \frac{B^2}{24(1-u)^2} \right] z^2 + O(x^3) = \quad C = \frac{B}{6(1-u)} - \frac{Bu}{8(1-u)} \\
&= \frac{Bz}{2(1-u)} + \left[\frac{B^2}{6(1-u)^2} - \frac{B^2u}{8(1-u)} + \frac{A}{2(1-u)} - \frac{B^2}{24(1-u)^2} \right] z^2 + O(x^3) = \\
&= \frac{Bz}{2(1-u)} + O(x^3) \quad \text{where } A = -\left(\frac{B}{2}\right)^2
\end{aligned}$$

- Testing in the particular case ($u=0$ and $R=1$) we have: $1 - \cos \alpha = \frac{Bz}{2}$
- Therefore choosing $B = 2$ and $A = -1$, it implies that $z = 1 - \cos \alpha$. The final approximation is:

$$(1 - \cos \theta)(1 - u) = 1 - \cos \alpha$$

3.3 Time delay

$$\Delta t = \int_R^\infty \frac{dr}{\left(1 - \frac{2M}{r}\right)} \left\{ \left[1 - \frac{b^2}{r^2} \left(1 - \frac{2M}{r} \right) \right]^{-\frac{1}{2}} - 1 \right\}$$

*Substitution obtained rigorously
with the mathematical method*

$$z = 1 - \cos \alpha$$

Performing the same
calculations made in the
case of the light bending

De Falco & Falanga (2015)

$$\frac{\Delta t}{R} = y \left[1 + \frac{uy}{8} + \frac{uy^2}{24} - \frac{u^2y^2}{112} \right] \quad \text{where} \quad u = \frac{r_s}{r} \quad y = \frac{(1 - \cos \alpha)}{(1 - u)}$$

3.4 Solid angle

$$d\Omega = \frac{\cos i}{D^2 \sin^2 \theta \left(1 - \frac{2M}{R}\right)} \frac{\sin^2 \alpha}{\cos \alpha} \left\{ \int_R^\infty \frac{dr}{r^2} \left[1 - \frac{b^2}{r^2} \left(1 - \frac{2M}{r} \right) \right]^{-\frac{3}{2}} \right\}^{-1}$$

*Substitution obtained rigorously
with the mathematical method*

$$z = 1 - \cos \alpha$$

Performing the same
calculations made in the
case of the light bending

De Falco & Falanga (2015)

$$d\Omega = \text{const} \cdot R \cdot \left[2z + (1 - 2C) z^2 + (1 - C + 2C^2 - 2D) z^3 \right]$$

where

$$C = \frac{4 - 3u}{1 - u} \quad D = \frac{39u^2 - 91u + 56}{56(1 - u)^2}$$

APPLICATIONS

Image of an accretion disk's formation in a binary system

4.1 Iron line profile

- Flux formula
$$F = \int_R \int_{\varphi} g^4 d\Omega$$

- Numerical code

40 millions of points

Original: more
than 60 min

Approximate: less
than 1 min

4.2 Polarization

Melia, Falanga & Goldwurm 2011

Schnittman & Krolik 2010
